ND:YAG LASER

Tattoos removal

Freckle removal

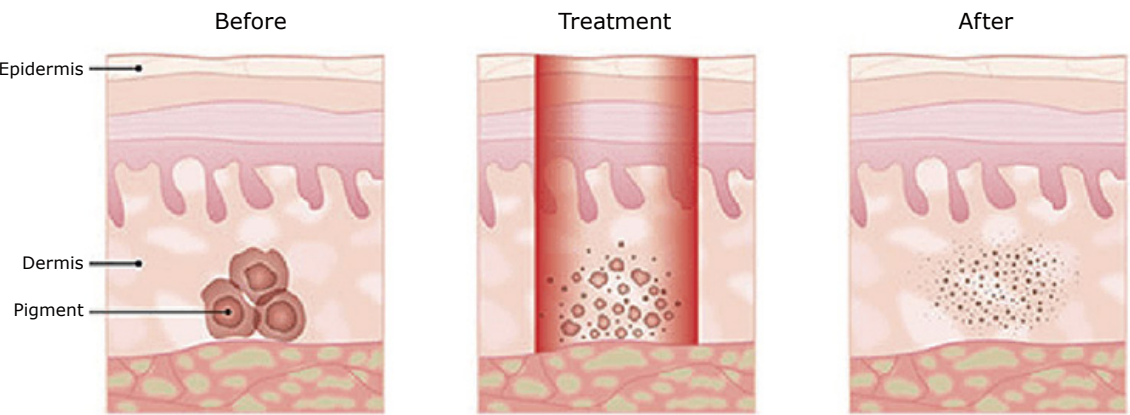

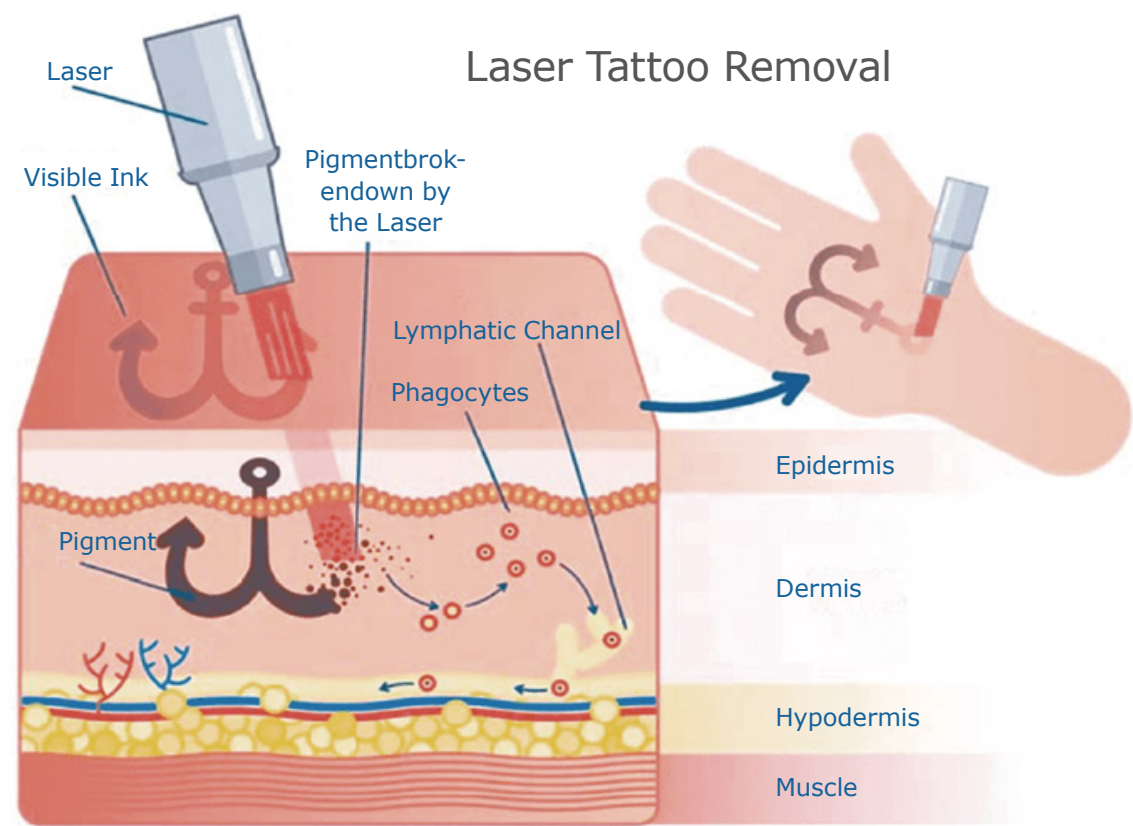

Skin whitening

Blackhead removal

How laser tattoo removal works?

Laser tattoo removal treatments work by sending light energy into the skin in quick pulses. With each pulse of the laser, the tattoo ink particles trapped in the dermal layer of skin absorb the energy and instantly shatter. The fragmented ink is then removed naturally by the body's immune system over the weeks following each treatment – making the tattoo fade in appearance.

Advantages

Precise Treatment

Utilizes Q-Switched mode with a pulse width of 8 nanoseconds for highly accurate procedures.

Stable and Durable Handpiece

Features a patented ceramic handpiece for reliable and long-lasting performance.

Powerful Energy Output

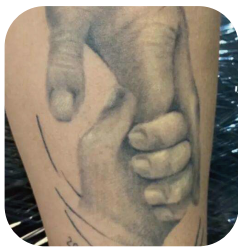

Equipped with a special high-grade YAG crystal, providing single pulse energy up to 200mJ and multi-pulse energy up to 1000mJ.

High-Quality Components

Built with a premium xenon lamp and powerful pump system for strong and continuous operation.

Specification

Laser Type	Single Light Double Rod
Laser Wavelength	1064nm,532nm,1320nm
Working Frequency	1-10Hz (Adjustable)
Pulse Width	8ns
Operation Interface	15.6 screen
Machine Power	500W
Energy Density	50-1000m/cm ²
Multi-pulse Energy	3.2J (500W Dual Capacitor)
Spot Size	6mm
Power Supply	AC 110-220V 5A 50Hz
